

Can you set up a logging sheet for this project for boreholes

Thought for 34s

Absolutely—done two ways so you can choose what fits your workflow:

1. If you want this inside the larger project workbook (with metadata, QAQC, etc.), use:
  - 📁 **Drillhole\_IronOre\_Logging\_Template\_Pro.xlsx**  
(already includes the **Borehole Logging** sheet wired to Reference Codes, plus ReadMe, QAQC, Standards, Methods & DLs)
2. If you prefer a **lightweight, logging-only workbook** (easy to hand out to field teams), use:
  - 📁 **Borehole\_Logging\_Standalone.xlsx**

What the logging sheet includes (both versions):

- Columns: Hole ID, Hole Type (dropdown), From/To, **Interval (auto)**, Lithology Code (dropdown), **Lithology Description (auto)**, Texture, Grain Size, Weathering, Alteration Type/Intensity, Mineralization Style, Hematite/Magnetite/Goethite %, Gangue %, Sulphides %, **Fe-oxides Total % (auto)**, Sample details (ID/From/To/Type/Weight), Recovery, RQD, Veining, Fracture Frequency, Structure Type, Dip, Dip Direction, Alpha, Beta, Orientation Quality, Moisture, Color, Comments, Logged By, Date.
- Validations: depth  $\geq 0$ ; % between 0–100; Dip 0–90; Dip Dir 0–360; Alpha/Beta 0–90.
- Visual checks:
  - **To < From** → red
  - **Interval  $\leq 0$**  (when From/To present) → red
  - **Fe-oxides + Gangue + Sulphides > 100%** → yellow
  - **Missing Hole ID** when depths exist → red
- Controlled vocabularies via dropdowns (lithology, textures, weathering, alteration, mineralization, etc.). In the standalone file, these live on a hidden **Lists** sheet; in the
